## 1 Running time analysis

#### Search trees

**Recall**: A search tree models the recursive calls of an algorithm. For a b-way branching where the parameter k decreases by a at each recursive call, the number of nodes is at most  $b^{k/a} \cdot (k/a + 1)$ .

If k/a and b are upper bounded by a function of k, and the time spent at each node is FPT (typically, polynomial), then we get an FPT running time.

### Recall: Measure Based Analysis

For more precise running time upper bounds:

Lemma 1 (Measure Analysis Lemma). Let

- A be a branching algorithm
- $\bullet$   $c \geq 0$  be a constant, and
- $\mu(\cdot), \eta(\cdot)$  be two measures for the instances of A,

such that on input I, A calls itself recursively on instances  $I_1, \ldots, I_k$ , but, besides the recursive calls, uses time  $O((\eta(I))^c)$ , such that

$$(\forall i) \quad \eta(I_i) \le \eta(I) - 1, \text{ and} \tag{1}$$

$$2^{\mu(I_1)} + \ldots + 2^{\mu(I_k)} \le 2^{\mu(I)}. \tag{2}$$

Then A solves any instance I in time  $O(\eta(I)^{c+1}) \cdot 2^{\mu(I)}$ .

## 2 Feedback Vertex Set

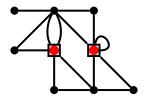

A feedback vertex set of a multigraph G = (V, E) is a set of vertices  $S \subseteq V$  such that G - S is acyclic.

FEEDBACK VERTEX SET

Input: Multigraph G = (V, E), integer k

Parameter: k

Question: Does G have a feedback vertex set of size at most k?

## Simplification Rules

We apply the first  $applicable^1$  simplification rule.

## (Loop)

If G has a loop  $vv \in E$ , then set  $G \leftarrow G - v$  and  $k \leftarrow k - 1$ .

## (Multiedge)

If E contains an edge uv more than twice, remove all but two copies of uv.

## (Degree-1)

If  $\exists v \in V$  with  $d_G(v) < 1$ , then set  $G \leftarrow G - v$ .

## (Budget-exceeded)

If k < 0, then return No.

#### (Degree-2)

If  $\exists v \in V$  with  $d_G(v) = 2$ , then denote  $N_G(v) = \{u, w\}$  and set  $G \leftarrow G' = (V \setminus \{v\}, (E \setminus \{vu, vw\}) \cup \{uw\})$ .

Lemma 2. (Degree-2) is sound.

*Proof.* Suppose S is a feedback vertex set of G of size at most k. Let

$$S' = \begin{cases} S & \text{if } v \notin S \\ (S \setminus \{v\}) \cup \{u\} & \text{if } v \in S. \end{cases}$$

Now,  $|S'| \leq k$  and S' is a feedback vertex set of G' since every cycle in G' corresponds to a cycle in G, with, possibly, the edge uw replaced by the path (u, v, w).

Suppose S' is a feedback vertex set of G' of size at most k. Then, S' is also a feedback vertex set of G.  $\Box$ 

## Remaining issues

- $\bullet$  A select–discard branching decreases k in only one branch
- $\bullet$  One could branch on all the vertices of a cycle, but the length of a shortest cycle might not be bounded by any function of k

## Idea:

- An acyclic graph has average degree < 2
- After applying simplification rules, G has average degree  $\geq 3$
- The selected feeback vertex set needs to be incident to many edges
- Does a feedback vertex set of size at most k contain at least one vertex among the f(k) vertices of highest degree?

<sup>&</sup>lt;sup>1</sup>A simplification rule is *applicable* if it modifies the instance.

The fvs needs to be incident to many edges

**Lemma 3.** If S is a feedback vertex set of G = (V, E), then

$$\sum_{v \in S} (d_G(v) - 1) \ge |E| - |V| + 1$$

*Proof.* Since F = G - S is acyclic,  $|E(F)| \le |V| - |S| - 1$ . Since every edge in  $E \setminus E(F)$  is incident with a vertex of S, we have

$$|E| = |E| - |E(F)| + |E(F)|$$

$$\leq \left(\sum_{v \in S} d_G(v)\right) + (|V| - |S| - 1)$$

$$= \left(\sum_{v \in S} (d_G(v) - 1)\right) + |V| - 1.$$

The fvs needs to contain a high-degree vertex

**Lemma 4.** Let G be a graph with minimum degree at least 3 and let H denote a set of 3k vertices of highest degree in G. Every feedback vertex set of G of size at most k contains at least one vertex of H.

*Proof.* Suppose not. Let S be a feedback vertex set with  $|S| \leq k$  and  $S \cap H = \emptyset$ . Then,

$$\begin{aligned} 2|E| - |V| &= \sum_{v \in V} (d_G(v) - 1) \\ &= \sum_{v \in H} (d_G(v) - 1) + \sum_{v \in V \setminus H} (d_G(v) - 1) \\ &\geq 3 \cdot (\sum_{v \in S} (d_G(v) - 1)) + \sum_{v \in S} (d_G(v) - 1) \\ &\geq 4 \cdot (|E| - |V| + 1) \\ \Leftrightarrow & 3|V| > 2|E| + 4. \end{aligned}$$

But this contradicts the fact that every vertex of G has degree at least 3.

Algorithm for Feedback Vertex Set

**Theorem 5.** FEEDBACK VERTEX SET can be solved in  $O^*((3k)^k)$  time.

*Proof (sketch).* • Exhaustively apply the simplification rules.

• The branching rule computes H of size 3k, and branches into subproblems (G-v,k-1) for each  $v \in H$ .

Current best:  $O^*(3.619^k)$  [Kociumaka, Pilipczuk, 2014]

## 3 Maximum Leaf Spanning Tree

A leaf of a tree is a vertex with degree 1. A spanning tree in a graph G = (V, E) is a subgraph of G that is a tree and has |V| vertices.

MAXIMUM LEAF SPANNING TREE

Input: connected graph G, integer k

Parameter: k

Question: Does G have a spanning tree with at least k leaves?

## **Property**

A k-leaf tree in G is a subgraph of G that is a tree with at least k leaves. A k-leaf spanning tree in G is a spanning tree in G with at least k leaves.

**Lemma 6.** Let G = (V, E) be a connected graph. G has a k-leaf tree  $\Leftrightarrow G$  has a k-leaf spanning tree.

*Proof.*  $(\Leftarrow)$ : trivial

(⇒): Let T be a k-leaf tree in G. By induction on x := |V| - |V(T)|, we will show that T can be extended to a k-leaf spanning tree in G.

Base case:  $x = 0 \checkmark$ .

Induction: x > 0, and assume the claim is true for all x' < x. Choose  $uv \in E$  such that  $u \in V(T)$  and  $v \notin V(T)$ . Since  $T' := (V(T) \cup \{v\}, E(T) \cup \{uv\})$  has  $\geq k$  leaves and < x external vertices, it can be extended to a k-leaf spanning tree in G by the induction hypothesis.

## Strategy

- $\bullet$  The branching algorithm will check whether G has a k-leaf tree.
- A tree with  $\geq 3$  vertices has at least one internal (= non-leaf) vertex.
- "Guess" an internal vertex r, i.e., do a |V|-way branching fixing an initial internal vertex r.
- In any branch, the algorithm has computed
  - T a tree in G
  - I the internal vertices of T, with  $r \in I$
  - -B a subset of the leaves of T where T may be extended: the boundary set
  - -L the remaining leaves of T
  - -X the external vertices  $V \setminus V(T)$
- The question is whether T can be extended to a k-leaf tree where all the vertices in L are leaves.

#### Simplification Rules

Apply the first applicable simplification rule:

## (Halt-Yes)

If  $|L| + |B| \ge k$ , then return YES.

#### (Halt-No)

If |B| = 0, then return No.

#### (Non-extendable)

If  $\exists v \in B$  with  $N_G(v) \cap X = \emptyset$ , then move v to L.

#### **Branching Lemma**

**Lemma 7** (Branching Lemma). Suppose  $u \in B$  and there exists a k-leaf tree T' extending T where u is an internal vertex. Then, there exists a k-leaf tree T'' extending  $(V(T) \cup N_G(u), E(T) \cup \{uv : v \in N_G(u) \cap X\})$ .

*Proof.* Start from  $T'' \leftarrow T'$  and perform the following operation for each  $v \in N_G(u) \cap X$ .

If  $v \notin V(T')$ , then add he vertex v and the edge uv. Otherwise, add the edge uv, creating a cycle C in T and remove the other edge of C incident to v. This does not decrease the number of leaves, since it only increases the number of edges incident to u, and u was already internal.

#### Follow Path Lemma

**Lemma 8** (Follow Path Lemma). Suppose  $u \in B$  and  $|N_G(u) \cap X| = 1$ . Let  $N_G(u) \cap X = \{v\}$ . If there exists a k-leaf tree extending T where u is internal, but no k-leaf tree extending T where u is a leaf, then there exists a k-leaf tree extending T where both u and v are internal.

*Proof.* Suppose not, and let T' be a k-leaf tree extending T where u is internal and v is a leaf. But then, T-v is a k-leaf tree as well.

## Algorithm

- Apply simplification rules
- Select  $u \in B$ . Branch into
  - $-u \in L$
  - $-u \in I$ . In this case, add  $X \cap N_G(u)$  to B (Branching Lemma). In the special case where  $|X \cap N_G(u)| = 1$ , denote  $\{v\} = X \cap N_G(u)$ , make v internal, and add  $N_G(v) \cap X$  to B, continuing the same way until reaching a vertex with at least 2 neighbors in X (Follow Path Lemma).
- In one branch, a vertex moves from B to L; in the other branch, |B| increases by at least 1.

## Running time analysis

- Measure  $\mu := 2k 2|L| |B| \ge 0$ .
- Branch where  $u \in L$ :
  - |B| decreases by 1, |L| increases by 1
  - $-\mu$  decreases by 1
- Branch where  $u \in I$ .
  - -u moves from B to I
  - $\geq 2$  vertices move from X to B
  - $-\mu$  decreases by at least 1
- Binary search tree
- Height  $\leq \mu \leq 2k$

### Result for Maximum Leaf Spanning Tree

**Theorem 9** ([Kneis, Langer, Rossmanith, 2011]). MAXIMUM LEAF SPANNING TREE can be solved in  $O^*(4^k)$  time.

Current best:  $O^*(3.72^k)$  [Daligault, Gutin, Kim, Yeo, 2010]

#### Exercise

A cluster graph is a graph where every connected component is a complete graph.

## Cluster Editing

Input: Graph G = (V, E), integer k

Parameter: A

Question: Is it possible to edit (add or delete) at most k edges of G so that it becomes a cluster graph?

Recall that G is a cluster graph iff G contains no induced  $P_3$  (path with 3 vertices) and has a kernel with  $O(k^2)$  vertices.

• Design an algorithm for Cluster Editing with running time  $3^k \cdot k^{O(1)} + n^{O(1)}$ .
