COMP2111 Week 10
Term 1, 2019
Course review
Course goals

- Reinforce concepts from Discrete Mathematics
- Emphasise the connections between Discrete Mathematics and Computer Science
- Use mathematical concepts to reason about programs:
  - Acquire (and understand) languages to formally specify systems
  - Acquire (and understand) structures to formally model systems
  - Learn how to prove that a program satisfies its specification

Assessment details

- Assignment 1: 20%
- Assignment 2: 15%
- Assignment 3: 15%
- Final exam: 50%

**NB**

*You must achieve 40% on the final exam and 50% overall to pass.*
Final exam

Goal: Assess your understanding of the concepts in this course

Requires you to demonstrate:

- Understanding of the topics covered
- Ability to apply these concepts and explain how they work

Lectures, assignments and tutorials have built you up to this point.
Exam details

Wednesday, 15 May, 8:45AM
Randwick Racecourse Ballroom

- 5 short answer questions and 5 long answer questions
- Topics taken from all content up to (and including) Context-Free Grammars.
- Each short answer question is worth 4 marks
  Each long answer question is worth 20 marks
  Total exam marks = 120 (i.e. 1 mark/minute)
- Time allowed: 120 minutes + 10 minutes reading time
- One handwritten or typed A4-sized sheet (double-sided is ok) of your own notes
- Formula sheet with rules/laws included
Exam structure

Short answer questions:
- Short questions designed to check your understanding of definitions
- 2–3 sentence justifications if necessary
- Answer in exam booklet not on exam paper

Long answer questions:
- “Proof” questions designed to examine your understanding at a deeper level
- Answer in exam booklet: start each question on a new page
- Put the order questions were attempted on the front.
Exam structure

Short answer questions:
- Short questions designed to check your understanding of definitions
- 2–3 sentence justifications if necessary
- Answer in exam booklet *not on exam paper*

Long answer questions:
- “Proof” questions designed to examine your understanding at a deeper level
- Answer in exam booklet: *start each question on a new page*
- Put the order questions were attempted on the front.
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Fundamentals

- Sets
- Languages
- Relations and Functions

Need to know for this course:
- Formal language definitions
- Relation/function definitions
- Equivalence relations
- Partial orders
Relation/Function definitions

- Reflexive, anti-reflexive
- Symmetric, anti-symmetric
- Transitive
- Composition, converse, inverse
- Injective, surjective, bijective
### Example (Properties)

#### Example

Common relations and their properties

Topic Summary

- Fundamentals
- **Set Theory and Boolean Algebras**
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Set Theory and Boolean Algebras

- Sets
- Boolean Algebras

Need to know for this course:
- Proofs using the Laws of Set Operations
- Proofs using the Laws of Boolean Algebras
- Principle of duality
Definition: Boolean Algebra

A Boolean algebra is a structure \((T, \lor, \land, ' , 0, 1)\) where

- \(0, 1 \in T\)
- \(\lor: T \times T \rightarrow T\) (called join)
- \(\land: T \times T \rightarrow T\) (called meet)
- \(': T \rightarrow T\) (called complementation)

and the following laws hold for all \(x, y, z \in T\):  

**commutative:**  
- \(x \lor y = y \lor x\)
- \(x \land y = y \land x\)

**associative:**  
- \((x \lor y) \lor z = x \lor (y \lor z)\)
- \((x \land y) \land z = x \land (y \land z)\)

**distributive:**  
- \(x \lor (y \land z) = (x \lor y) \land (x \lor z)\)
- \(x \land (y \lor z) = (x \land y) \lor (x \land z)\)

**identity:**  
- \(x \lor 0 = x,\)  \(x \land 1 = x\)

**complementation:**  
- \(x \lor x' = 1,\)  \(x \land x' = 0\)
Example (Proof using Laws of Set Operations)

Example (Idempotence of $\cup$)

\[
A = A \cup \emptyset \quad \text{(Identity)}
\]
\[
= A \cup (A \cap A^c) \quad \text{(Complementation)}
\]
\[
= (A \cup A) \cap (A \cup A^c) \quad \text{(Distributivity)}
\]
\[
= (A \cup A) \cap U \quad \text{(Complementation)}
\]
\[
= (A \cup A) \quad \text{(Identity)}
\]
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Inductive definitions, datatypes, and proofs

- Recursion
- Recursive datatypes and functions
- Induction and structural induction

Need to know for this course:
- How to define structures/functions recursively
- How to prove properties of recursively defined structures
Inductive definitions

Inductively defined structure:
- Base case(s): “Minimal” structures
- Inductive case(s): How to build more complex structures from simple ones

Recursively defined functions:
- Base case(s): Terminating conditions
- Recursive case(s): Call functions with “smaller” inputs
Example (Inductive definitions)

Natural numbers:
- Base case: 0
- Inductive case: $n + 1$ where $n$ is a Natural number

$\Sigma^*$:
- Base case: $\lambda$
- Inductive case: $aw$ where $a \in \Sigma$ and $w \in \Sigma^*$

Well-formed formulas
$L$ programs
Regular expressions
Example (Inductive definitions)

Example (Recursively defined functions)

- \( \text{length} : \Sigma^* \rightarrow \Sigma^* \)
  - Base case: \( \text{length}(\lambda) = 0 \)
  - Inductive case: \( \text{length}(aw) = 1 + \text{length}(w) \)

- \( [\cdot]_v : \text{WFFs} \rightarrow \mathbb{B} \)
- \( [\cdot]_\eta^\iota : \text{WFFs} \rightarrow \mathbb{B} \)
- \( [\cdot] : \text{PROGRAMS} \rightarrow \text{Pow}(\text{ENV} \times \text{ENV}) \)
- \( L(\cdot) : \text{REGEXP} \rightarrow \text{Pow}(\Sigma^*) \)
Structural Induction

Basic induction allows us to assert properties over all natural numbers. The induction scheme (layout) uses the recursive definition of $\mathbb{N}$.

The induction schemes can be applied not only to natural numbers (and integers) but to any partially ordered set in general – especially those defined recursively.

The basic approach is always the same — we need to verify that

- [B] the property holds for all minimal objects — objects that have no predecessors; they are usually very simple objects allowing immediate verification
- [I] for any given object, if the property in question holds for all its predecessors (‘smaller’ objects) then it holds for the object itself
Example (Structural Induction)

Example

Let \( P(w) \) be the proposition that, for all \( v \in \Sigma^* \):

\[
\text{length}(wv) = \text{length}(w) + \text{length}(v).
\]

We will show that \( P(w) \) holds for all \( w \in \Sigma^* \) by structural induction on \( w \).

Base case \( (w = \lambda) \):

\[
\begin{align*}
\text{length}(\lambda v) &= \text{length}(v) \quad \text{(concat.B)} \\
&= 0 + \text{length}(v) \\
&= \text{length}(w) + \text{length}(v) \quad \text{(length.B)}
\end{align*}
\]
Example (Structural Induction)

Example

Let $P(w)$ be the proposition that, for all $v \in \Sigma^*$:

$$\text{length}(wv) = \text{length}(w) + \text{length}(v).$$

We will show that $P(w)$ holds for all $w \in \Sigma^*$ by structural induction on $w$.

Inductive case ($w = aw'$): Assume that $P(w')$ holds. That is, for all $v \in \Sigma^*$: $\text{length}(w'v) = \text{length}(w') + \text{length}(v)$. Then:

$$\begin{align*}
\text{length}((aw')v) &= \text{length}(a(w'v)) \\
&= 1 + \text{length}(w'v) \\
&= 1 + \text{length}(w') + \text{length}(v) \\
&= \text{length}(aw') + \text{length}(v)
\end{align*}$$

(concat. I) (length. I) (IH) (length. I)
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Propositional Logic

- Well-formed formulas (SYNTAX)
- Truth assignments and valuations (SEMANTICS)
- Conjunctive/Disjunctive Normal Forms

Need to know for this course

- Difference between syntax and semantics
- CNF/DNF definitions and (any) technique for converting a formula into CNF/DNF
Syntax of Prop. Logic (Well-formed formulas)

Let \( \text{PROP} = \{p, q, r, \ldots\} \) be a set of propositional letters.
Consider the alphabet

\[ \Sigma = \text{PROP} \cup \{\top, \bot, \neg, \land, \lor, \to, \leftrightarrow, (, )\}. \]

The well-formed formulas (wffs) over \( \text{PROP} \) is the smallest set of words over \( \Sigma \) such that:

- \( \top, \bot \) and all elements of \( \text{PROP} \) are wffs
- If \( \varphi \) is a wff then \( \neg \varphi \) is a wff
- If \( \varphi \) and \( \psi \) are wffs then \( (\varphi \land \psi), (\varphi \lor \psi), (\varphi \to \psi) \), and \( (\varphi \leftrightarrow \psi) \) are wffs.
A truth assignment (or model) is a function $\nu : \text{PROP} \rightarrow \mathbb{B}$.

We can extend $\nu$ to a function $[\cdot]_{\nu} : \text{WFFs} \rightarrow \mathbb{B}$ recursively:

- $[\top]_{\nu} = \text{true}$, $[\bot]_{\nu} = \text{false}$
- $[p]_{\nu} = \nu(p)$
- $[\neg \varphi]_{\nu} = \neg [\varphi]_{\nu}$
- $[[\varphi \land \psi]]_{\nu} = [\varphi]_{\nu} \land [\psi]_{\nu}$
- $[[\varphi \lor \psi]]_{\nu} = [\varphi]_{\nu} \lor [\psi]_{\nu}$
- $[[\varphi \rightarrow \psi]]_{\nu} = \neg [\varphi]_{\nu} \lor [\psi]_{\nu}$
- $[[\varphi \leftrightarrow \psi]]_{\nu} = (\neg [\varphi]_{\nu} \lor [\psi]_{\nu}) \land (\neg [\psi]_{\nu} \lor [\varphi]_{\nu})$
A valuation **satisfies** a theory $T$ if $\llbracket \varphi \rrbracket_v = \text{true}$ for every $\varphi \in T$

A theory/formula is **satisfiable** if there is some valuation that satisfies it.

A formula is a **tautology** if every valuation satisfies it.

Entailment: $T \models \varphi$ if for every valuation that satisfies $T$, we have $\llbracket \varphi \rrbracket_v = \text{true}$

Logical equivalence: $\varphi \equiv \psi$ if $\llbracket \varphi \rrbracket_v = \llbracket \psi \rrbracket_v$ for all valuations
Example (Working with Propositional Logic)

Example

You are planning a party, but your friends are a bit touchy about who will be there.

1. If John comes, he will get very hostile if Sarah is there.
2. Sarah will only come if Kim will be there also.
3. Kim says she will not come unless John does.

Who can you invite without making someone unhappy?
Example (Working with Propositional Logic)

Example

Translation to logic: let $J, S, K$ represent “John (Sarah, Kim) comes to the party”. Then the constraints are:

1. $J \rightarrow \neg S$
2. $S \rightarrow K$
3. $K \rightarrow J$

Thus, for a successful party to be possible, we want the formula $\phi = (J \rightarrow \neg S) \land (S \rightarrow K) \land (K \rightarrow J)$ to be satisfiable.
Example (Working with Propositional Logic)

**Example**

Truth table: Each row corresponds to a valuation

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th>( J \rightarrow \neg S )</th>
<th>( S \rightarrow K )</th>
<th>( K \rightarrow J )</th>
<th>( \phi )</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>F</td>
<td>F</td>
<td>T</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>F</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>T</td>
<td>F</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>T</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>T</td>
<td>T</td>
<td>T</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

Conclusion: a party satisfying the constraints can be held. Invite nobody, or invite John only, or invite Kim and John.
Conjunctive/Disjunctive Normal Forms

CNFs and DNFs are syntactic forms:

**Literal**: A propositional variable or the negation of a propositional variable

**Clause**: A CNF-clause is a disjunction (∨) of literals. A DNF-clause is a conjunction (∧) of literals

**CNF/DNF**: A formula is in CNF (DNF) if it is a conjunction (disjunction) of CNF-clauses (DNF-clauses).

**Theorem**

*Every propositional formula is logically equivalent to one in CNF and one in DNF.*
Example (CNF/DNF)

**Example**

Consider $\varphi = (y \rightarrow x)$:

<table>
<thead>
<tr>
<th>$x$</th>
<th>$y$</th>
<th>$y \rightarrow x$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$F$</td>
<td>$F$</td>
<td>$T$</td>
</tr>
<tr>
<td>$F$</td>
<td>$T$</td>
<td>$F$</td>
</tr>
<tr>
<td>$T$</td>
<td>$F$</td>
<td>$T$</td>
</tr>
<tr>
<td>$T$</td>
<td>$T$</td>
<td>$T$</td>
</tr>
</tbody>
</table>

Then $\varphi$ is logically equivalent to:

- $(\neg x \land \neg y) \lor (x \land \neg y) \lor (x \land y)$ (DNF)
- $\neg y \lor (x \land y)$ (DNF)
- $\neg y \lor x$ (CNF and DNF)
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Predicate Logic

- Well-formed formulas (SYNTAX)
- Models and environments (SEMANTICS)

Need to know for this course

- Translate requirements into Propositional and/or Predicate logic
- Syntax and Semantics definitions
- Satisfiability, Validity, Logical equivalence
Syntax of Predicate (First-Order) Logic

Given a vocabulary (predicate symbols, function symbols, constant symbols):

- **Terms** defined recursively over a set of variables
- **Formulas** defined recursively:
  - Atomic formulas: built from predicates and equality, and terms
  - Other formulas: built recursively using Boolean connectives and quantifiers
- Parentheses usage relaxed to aid readability
- Free variables “captured” syntactically with $\varphi(x)$ notation
Semantics of Predicate (First-Order) Logic

Given a vocabulary (predicate symbols, function symbols, constant symbols):

- A **model** interprets all the symbols of the vocabulary over some domain
- $\llbracket \phi \rrbracket_M$ is a **relation** on $\text{Dom}(M)$
- An **environment** assigns variables to elements of $\text{Dom}(M)$
- $\llbracket \phi \rrbracket_M^\eta$ “looks-up” the tuple defined by $\eta$ in the relation $\llbracket \phi \rrbracket_M$ and returns an element of $\mathbb{B}$ depending on its presence
Satisfiability and Validity

A formula, $\varphi$, is:

- **Satisfiable** if there is some model and environment (interpretation) such that $\llbracket \varphi \rrbracket^\eta_M = \text{true}$ ($M, \eta \models \varphi$)
- **True in a model** $M$ if for all environments $\eta$, $M, \eta \models \varphi$
- A **Logical validity** if it is true in all models
- A **Logical consequence** of a set of formulas $T$ (written $T \models \varphi$) if $M, \eta \models \varphi$ for all interpretations which satisfy every element of $T$.
- **Logically equivalent** to a formula $\psi$ if $\llbracket \varphi \rrbracket^\eta_M = \llbracket \psi \rrbracket^\eta_M$ for all interpretations
Satisfiability and Validity

Theorem

- $\emptyset \models \varphi$ if, and only if, $\varphi$ is a logical validity
- $\varphi \models \psi$ if, and only if, $\varphi \rightarrow \psi$ is a logical validity
- $\varphi \equiv \psi$ if, and only if, $\varphi \leftrightarrow \psi$ is a logical validity
Example (Interpretations)

∀x∀y((y = x + 1) → (x ≤ y))

- \(\mathbb{N}\) with the standard definitions of \(\leq\), \(+\), and \(1\): \text{true}
- \(\{0, 1, 2, 3, 4\}\) with the standard definition of \(\leq\) and \(1\), and \(m + n\) defined as \(m + n \mod 5\): \text{false}
- The directed graph \(G = (V, E)\) shown below with \(\leq = E\); and \(v + w\) defined to be \(w\): \text{true}
Example (Interpretations)

Example

∀x∀y((y = x + 1) → (x ≤ y))

- \( \mathbb{N} \) with the standard definitions of \( \leq \), +, and 1: true
- \{0, 1, 2, 3, 4\} with the standard definition of \( \leq \) and 1, and \( m + n \) defined as \( m + n \) (mod 5): false
- The directed graph \( G = (V, E) \) shown below with \( \leq \) = \( E \); and \( v + w \) defined to be \( w \): true

\[\begin{array}{c}
\text{1} \\
\text{2} \\
\text{3} \\
\text{4}
\end{array}\]

\[\begin{array}{ccc}
\text{1} & \rightarrow & \text{3} \\
\text{2} & \rightarrow & \text{1} \\
\text{3} & \rightarrow & \text{2, 4} \\
\text{4} & \rightarrow & \text{3}
\end{array}\]
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Natural Deduction

- Formal proofs
- Natural Deduction for Propositional Logic
- Natural Deduction for Predicate Logic

Need to know for this course:
- One formal proof style
- How to present proofs in the style
- Rules of Natural Deduction for Propositional Logic
- Rules of Natural Deduction for Predicate Logic
- Relation between Proofs and fundamental logical concepts
Formal proof styles

Three main styles:
- Tabular
- Fitch-style
- Tree

Each logical step should indicate:
- A line number for later reference
- The (undischarged) assumptions required to make the derivation
- The result of the derivation
- The derivation rule used
- Which previously computed results were required to for the rule
### Proof styles: Table

<table>
<thead>
<tr>
<th>Line</th>
<th>Premises</th>
<th>Formula</th>
<th>Rule</th>
<th>Ref</th>
</tr>
</thead>
<tbody>
<tr>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
</tr>
</tbody>
</table>

**Advantages:** Easy to typeset; Compact representation

**Disadvantages:** Structure can be difficult to follow
Proof styles: Fitch-style

1. \( \varphi \)

2. \( \psi_1 \)

3. \( \vdots \)

Advantages: Scope of assumptions is clear; Style used in online checker

Disadvantages: Rule application often not obvious
Proof styles: Tree

\[
\frac{A \rightarrow B \quad A}{A \land B} \quad (\rightarrow E)
\]

\[
\frac{A \quad B}{A \land B} \quad (^{-}l)
\]

**Advantages:** Proof structure is clear; Construct directly from rules

**Disadvantages:** Often unwieldy presentations
Natural Deduction

\( T \vdash \varphi: \textbf{Prove } \varphi \text{ from } T \)

15+7 Inference rules based on introducing/eliminating boolean operators:

\[
\begin{align*}
\frac{A \quad B}{A \land B} & \quad (\land\text{-I}) \\
\frac{A \land B}{A} & \quad (\land\text{-E1}) \\
\frac{A \land B}{B} & \quad (\land\text{-E2}) \\
\frac{A}{A \lor B} & \quad (\lor\text{-I1}) \\
\frac{B}{A \lor B} & \quad (\lor\text{-I2}) \\
\frac{[A] \quad [B] \quad \vdots \quad \vdots \quad A \lor B \quad C \quad C}{C} & \quad (\lor\text{-E})
\end{align*}
\]
Natural Deduction

\[ T \vdash \varphi: \text{Prove } \varphi \text{ from } T \]

15+7 Inference rules based on introducing/eliminating boolean operators:

\[
\frac{A}{A \land B} \quad (\land\text{-I}) \quad \frac{A \land B}{A} \quad (\land\text{-E}_1) \quad \frac{A \land B}{B} \quad (\land\text{-E}_2)
\]

\[
\frac{A}{A \lor B} \quad (\lor\text{-I}_1) \quad \frac{B}{A \lor B} \quad (\lor\text{-I}_2) \quad \frac{[A]}{A \lor B} \quad \frac{[B]}{A \lor B} \quad \frac{\vdots \quad \vdots}{A \lor B} \quad \frac{C \quad C}{C} \quad (\lor\text{-E})
\]
Natural Deduction

\[
\begin{align*}
[A] & \\
\vdots & \\
B & \\
\hline \\
A \rightarrow B & \text{ (→-I)} \\
\end{align*}
\]

\[
\begin{align*}
A \rightarrow B & \quad A \\
\hline \\
B & \\
\end{align*}
\text{ (→-E)}
\]

\[
\begin{align*}
[A] & \quad [B] \\
\vdots & \quad \vdots \\
B & \quad A \\
\hline \\
A \leftrightarrow B & \text{ (↔-I)} \\
\end{align*}
\]

\[
\begin{align*}
A \leftrightarrow B & \quad A \\
\hline \\
B & \\
\end{align*}
\text{ (↔-E1)}
\]

\[
\begin{align*}
A \leftrightarrow B & \quad B \\
\hline \\
A & \\
\end{align*}
\text{ (↔-E1)}
\]
Natural Deduction

\[

Example (Fitch-style proof)

Example

Prove: \( \vdash \forall x \forall y \ (x = y) \rightarrow (y = x) \)

1. \( a = b \)
2. \( a = a \)  \(-I\)
3. \( b = a \)  \(-E1: 1,2\)
4. \( (a = b) \rightarrow (b = a) \)  \(-l: 1-3\)
5. \( \forall y \ (a = y) \rightarrow (y = a) \)  \(\forall-l: 4\)
6. \( \forall x \forall y \ (x = y) \rightarrow (y = x) \)  \(\forall-l: 5\)
Example (Fitch-style proof)

Example

Prove: $\vdash \forall x \forall y (x = y) \rightarrow (y = x)$

1. $a = b$
2. $a = a$ = -I
3. $b = a$ = -E1: 1,2
4. $(a = b) \rightarrow (b = a)$ →-I: 1-3
5. $\forall y (a = y) \rightarrow (y = a)$ ∀-I: 4
6. $\forall x \forall y (x = y) \rightarrow (y = x)$ ∀-I: 5
Example (Fitch-style proof)

Prove:  \( \vdash \forall x \forall y (x = y) \rightarrow (y = x) \)

1. \( a = b \)

2. \( a = a \)  \( =\text{-}I \)

3. \( b = a \)  \( =\text{-}E1: 1,2 \)

4. \( (a = b) \rightarrow (b = a) \)  \( \rightarrow\text{-}I: 1–3 \)

5. \( \forall y (a = y) \rightarrow (y = a) \)  \( \forall\text{-}I: 4 \)

6. \( \forall x \forall y (x = y) \rightarrow (y = x) \)  \( \forall\text{-}I: 5 \)
Example (Fitch-style proof)

Example

Prove: \( \vdash \forall x \forall y (x = y) \rightarrow (y = x) \)

1. \( a = b \)

2. \( a = a \)  
   \(-I: 1\)

3. \( b = a \)  
   \(-E1: 1, 2\)

4. \( (a = b) \rightarrow (b = a) \)  
   \(-l: 1-3\)

5. \( \forall y (a = y) \rightarrow (y = a) \)  
   \(-l: 4\)

6. \( \forall x \forall y (x = y) \rightarrow (y = x) \)  
   \(-l: 5\)
Example (Fitch-style proof)

Example

Prove: $\vdash \forall x \forall y (x = y) \rightarrow (y = x)$

1. $a = b$
2. $a = a$                      $=\mathfrak{I}$
3. $b = a$                      $=\mathfrak{E}_1: 1, 2$
4. $(a = b) \rightarrow (b = a)$ $\rightarrow\mathfrak{I}: 1–3$
5. $\forall y (a = y) \rightarrow (y = a)$ $\forall\mathfrak{I}: 4$
6. $\forall x \forall y (x = y) \rightarrow (y = x)$ $\forall\mathfrak{I}: 5$
Example (Fitch-style proof)

Prove:  \[ \forall x \forall y (x = y) \rightarrow (y = x) \]

1. \( a = b \)
2. \( a = a \)  \([-I]\)
3. \( b = a \)  \([-E1: 1,2]\)
4. \( (a = b) \rightarrow (b = a) \)  \([-l: 1-3]\)
5. \( \forall y (a = y) \rightarrow (y = a) \)  \(-l: 4\)
6. \( \forall x \forall y (x = y) \rightarrow (y = x) \)  \(-l: 5\)
Example (Fitch-style proof)

Example

Prove: \( \vdash \forall x \forall y \ (x = y) \rightarrow (y = x) \)

1. \( a = b \)

2. \( a = a \) \( \text{=-I} \)

3. \( b = a \) \( \text{=-E1: 1,2} \)

4. \( (a = b) \rightarrow (b = a) \) \( \rightarrow \text{-I: 1-3} \)

5. \( \forall y \ (a = y) \rightarrow (y = a) \) \( \forall \text{-I: 4} \)

6. \( \forall x \forall y \ (x = y) \rightarrow (y = x) \) \( \forall \text{-I: 5} \)
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Hoare Logic

- Simple imperative language $\mathcal{L}$
- Hoare triple $\{ \phi \} P \{ \psi \}$ (SYNTAX)
- Derivation rules (PROOFS)
- Semantics for Hoare logic (SEMANTICS)

Need to know for this course:

- Write programs in $\mathcal{L}$.
- Give proofs using the Hoare logic rules
- Definition of $\llbracket \cdot \rrbracket$
The language $\mathcal{L}$ is a simple imperative programming language made up of four statements:

**Assignment:** $x := e$

where $x$ is a variable and $e$ is an arithmetic expression.

**Sequencing:** $P; Q$

**Conditional:** if $b$ then $P$ else $Q$ fi

where $b$ is a boolean expression.

**While:** while $b$ do $P$ od
Hoare triple (Syntax)

\[ \{ \varphi \} P \{ \psi \} \]

Intuition:
If \( \varphi \) holds in a state of some computational model then \( \psi \) holds in the state reached after a successful execution of \( P \).

\[ \vdash \{ \varphi \} P \{ \psi \} \]

\( \{ \varphi \} P \{ \psi \} \) is derivable using the proof rules of Hoare Logic.

\[ \models \{ \varphi \} P \{ \psi \} \]

\( \{ \varphi \} P \{ \psi \} \) is valid according to the semantic interpretation.
Hoare triple (Syntax)

\{\varphi\} P \{\psi\}

Intuition:
If \(\varphi\) holds in a state of some computational model
then \(\psi\) holds in the state reached after a successful execution of \(P\).

\(\vdash \{\varphi\} P \{\psi\}\)

\{\varphi\} P \{\psi\} is **derivable** using the proof rules of Hoare Logic

\(\models \{\varphi\} P \{\psi\}\)

\{\varphi\} P \{\psi\} is **valid** according to the semantic interpretation.
Hoare triple (Syntax)

{ϕ} P {ψ}

Intuition:
If ϕ holds in a state of some computational model
then ψ holds in the state reached after a successful execution of P.

\[ \vdash \{ϕ\} P \{ψ\} \]

{ϕ} P {ψ} is **derivable** using the proof rules of Hoare Logic

\[ \models \{ϕ\} P \{ψ\} \]

{ϕ} P {ψ} is **valid** according to the semantic interpretation.
Hoare logic rules

(ass)

\[
\{ \varphi[e/x] \} \ x := e \{ \varphi \}
\]

(seq)

\[
\frac{\{ \varphi \} P \{ \psi \} \quad \{ \psi \} Q \{ \rho \}}{\{ \varphi \} P; Q \{ \rho \}}
\]

(if)

\[
\frac{\{ \varphi \land g \} P \{ \psi \} \quad \{ \varphi \land \neg g \} Q \{ \psi \}}{\{ \varphi \} \text{ if } g \text{ then } P \text{ else } Q \text{ fi } \{ \psi \}}
\]
Hoare logic rules

\[ \{ \varphi(e) \} \ x := e \ {\varphi(x)} \]  

(ass)

\[ \begin{array}{c}  
\{ \varphi \} \ P \ \{ \psi \} \quad \{ \psi \} \ Q \ \{ \rho \} 
\end{array} \]

(\text{seq})

\[ \begin{array}{c}  
\{ \varphi \land g \} \ P \ \{ \psi \} \quad \{ \varphi \land \neg g \} \ Q \ \{ \psi \} 
\end{array} \]

(if)
Hoare logic rules

\end{align*}\]
**Hoare logic semantics**

\( \text{Env} \): set of environments (functions that map variables to numeric values)

\( \langle \cdot \rangle : \text{Predicates} \rightarrow \text{Pow}(\text{Env}) \), given by:

\[
\langle \varphi \rangle := \{ \eta \in \text{Env} : [\varphi]^{\eta} = \text{true} \}.
\]

\( [\cdot] : \text{Programs} \cup \text{Predicates} \rightarrow \text{Pow}(\text{Env} \times \text{Env}) \)
Hoare logic semantics

\[
\begin{align*}
\llbracket \cdot \rrbracket : \text{Programs} \cup \text{Predicates} & \to \text{Pow}(\text{Env} \times \text{Env}) \\
\text{For predicates:} \quad \llbracket \varphi \rrbracket & = \{ (\eta, \eta) : \eta \in \langle \varphi \rangle \} \\
\text{For programs: Inductively:} & \\
\llbracket x := e \rrbracket & = \{ (\eta, \eta') : \eta' = \eta[x \mapsto \llbracket e \rrbracket^\eta] \} \\
\llbracket P ; Q \rrbracket & = \llbracket P \rrbracket ; \llbracket Q \rrbracket \\
\llbracket \text{if } b \text{ then } P \text{ else } Q \text{ fi} \rrbracket & = \llbracket b ; P \rrbracket \cup \llbracket \neg b ; Q \rrbracket \\
\llbracket \text{while } b \text{ do } P \text{ od} \rrbracket & = \llbracket b ; P \rrbracket^* ; \llbracket \neg b \rrbracket
\end{align*}
\]
Example ([z := 2])

State space ($E_{NV}$)
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
Transition systems

- Definitions:
  - States and Transitions
  - (Non-)determinism
  - Reachability
- The Invariant Principle
- Termination

Need to know for this course:
- Definitions
- Invariant principle
- Termination proofs
A **preserved invariant** of a transition system is a unary predicate \( \varphi \) on states such that if \( \varphi(s) \) holds and \( s \rightarrow s' \) then \( \varphi(s') \) holds.

**Invariant principle**

If a preserved invariant holds at a state \( s \), then it holds for all states reachable from \( s \).
Termination

A transition system \((S, \rightarrow)\) terminates from a state \(s\) if there is an \(N\) such that all runs from \(s\) have length at most \(N\).

A derived variable is a function \(f : S \rightarrow \mathbb{R}\).

A derived variable is strictly decreasing if \(s \rightarrow s'\) implies \(f(s) > f(s')\).

**Theorem**

If \(f\) is an \(\mathbb{N}\)-valued, strictly decreasing derived variable, then the length of any run from \(s\) is at most \(f(s)\).
Example (Transition system)

- **States:** \( \mathbb{Z} \times \mathbb{Z} \times \mathbb{Z} \)
- **Transition:**
  - \((x, y, r) \rightarrow (x^2, \frac{y}{2}, r)\) if \(y\) is even
  - \((x, y, r) \rightarrow (x^2, \frac{y-1}{2}, rx)\) if \(y\) is odd
- **Preserved invariant:** \(rx^y\) is a constant
- \(\Rightarrow\) All states reachable from \((m, n, 1)\) will satisfy \(rx^y = m^n\)
- \(\Rightarrow\) if \((x, 0, r)\) is reachable from \((m, n, 1)\) then \(r = m^n\).
Automata and formal languages

- Deterministic Finite Automata (DFAs)
- Non-deterministic Finite Automata (NFAs)
- Regular expressions
- Myhill-Nerode theorem
- Context-free languages

Need to know for this course:
- The language defined by DFAs, NFAs, Regular expressions, and context-free grammars
- Principal applications of the Myhill-Nerode theorem
Topic Summary

- Fundamentals
- Set Theory and Boolean Algebras
- Inductive definitions, datatypes, and proofs
- Propositional Logic
- Predicate Logic
- Natural Deduction
- Hoare Logic
- Transition systems
- Automata and formal languages
A deterministic finite automaton (DFA) is a tuple $(Q, \Sigma, \delta, q_0, F)$ where

- $Q$ is a finite set of states
- $\Sigma$ is the input alphabet
- $\delta : Q \times \Sigma \rightarrow Q$ is the transition function
- $q_0 \in Q$ is the start state
- $F \subseteq Q$ is the set of final/accepting states
A **non-deterministic finite automaton (NFA)** is a tuple $(Q, \Sigma, \delta, q_0, F)$ where

- $Q$ is a finite set of states
- $\Sigma$ is the input alphabet
- $\delta \subseteq Q \times (\Sigma \cup \{\epsilon\}) \times Q$ is the transition relation
- $q_0 \in Q$ is the start state
- $F \subseteq Q$ is the set of final/accepting states
Language accepted by a DFA/NFA

A sequence of input symbols defines a run in a DFA (or several runs in an NFA).

A run is accepting if it ends in a final state. A word is accepted if at least one run is accepting.

$L(M)$ is the set of all words accepted by $M$. 

Example (Language of an NFA)

Accepted words: 1, 01, 11, 10, …
Regular expressions

Specify language by “matching”

Defined recursively:

- $\emptyset$ is a regular expression
- $\epsilon$ is a regular expression
- $a$ is a regular expression for all $a \in \Sigma$
- If $E_1, E_2$ are regular expressions then so are:
  - $E_1 + E_2$
  - $E_1 E_2$
  - $E_1^*$

$L(E)$: set of words that match $E$
Example (Regular expression)

Example

The following words match \((000 + 10)*01:\)

- 01
- 101001
- 000101000001
Myhill-Nerode theorem

Algebraic characterization of regular languages

Syntactic (context) equivalence:

\[ v \equiv_L w \quad \text{if, and only if,} \quad \forall z. wz \in L \iff vz \in L. \]

**Theorem (Myhill-Nerode theorem)**

A language \( L \) is regular if, and only if, \( \equiv_L \) has finitely many equivalence classes. Moreover the number of equivalence classes is equal to the minimum number of states of a DFA required to recognise \( L \).
Context free grammars

Generative means of specifying language.

Grammar consists of:
- Non-terminal symbols
- Terminal symbols
- Rules for rewriting non-terminal symbols into strings of non-terminal and terminal symbols
- A starting (non-terminal) symbol

Word $w$ generated by a grammar if a series of rewrite rules, starting from the start symbol, will result in $w$.

Language of a grammar is the set of words generated by it.
Example (CFGs)

Example

Formal (recursive) definitions:
- Regular expressions
- Propositional formulas
- $\mathcal{L}$ programs (and other languages)
