Polynomial-time reduction

Definition 1

A polynomial-time reduction from a decision problem Π_1 to a decision problem Π_2 is a polynomial-time algorithm, which, for any instance of Π_1 produces an equivalent instance of Π_2 .

If there exists a polynomial-time reduction from Π_1 to Π_2 , we say that Π_1 is polynomial-time reducible to Π_2 and write $\Pi_1 \leq_P \Pi_2$.

Important: \leq_{P} is transitive.

New polynomial-time algorithms via reductions

Lemma 2

If Π_1, Π_2 are decision problems such that $\Pi_1 \leq_{\mathsf{P}} \Pi_2$, then $\Pi_2 \in P$ implies $\Pi_1 \in P$.

S. Huang (UNSW) Paramaterized interestability Semester 2, 2017

P vs. NP problem

 $P \neq NP$?

S. Huang (UNSW) Parameter 2, 2017

P vs. NP problem

 $P \neq NP$?

One of the seven famous Millennium Prize Problems stated by the Clay Mathematics Institute in 2000.

P vs. NP problem

 $P \neq NP$?

One of the seven famous Millennium Prize Problems stated by the Clay Mathematics Institute in 2000.

The hardest problem in NP

Satisfiability is 'the' hardest problem in NP.

Stephen Cook. The complexity of theorem-proving procedures. Proc. 3rd Ann. ACM symp. on Theory of Computing. 151–158 (1971).

S. Huang (UNSW) Communication Semester 2, 2017

P vs. NP problem

 $P \neq NP$?

One of the seven famous Millennium Prize Problems stated by the Clay Mathematics Institute in 2000.

The hardest problem in NP

Satisfiability is 'the' hardest problem in NP.

Stephen Cook. The complexity of theorem-proving procedures. Proc. 3rd Ann. ACM symp. on Theory of Computing. 151-158 (1971).

NP-completeness

Definition 3 (NP-hard)

A decision problem Π is NP-hard if $\Pi' \leq_P \Pi$ for every $\Pi' \in NP$.

Definition 4 (NP-complete)

A decision problem Π is NP-complete (in NPC) if

- \bullet $\Pi \in \mathsf{NP}$, and

S. Huang (UNSW) Paramatorized introdubility Semester 2, 2017

Proving NP-completeness

Lemma 5

If Π is a decision problem such that $\Pi' \leq_P \Pi$ for some NP-hard decision problem Π' , then Π is NP-hard.

If, in addition, $\Pi \in \mathsf{NP}$, then $\Pi \in \mathsf{NPC}$.

Proving NP-completeness II

Method to prove that a decision problem Π is NP-complete:

- Prove $\Pi \in NP$
- ② Prove II is NP-hard.
 - Select a known NP-hard decision problem Π' .
 - Describe an algorithm that transforms every instance I of Π' to an instance r(I) of $\Pi.$
 - Prove that for each instance I of Π' , we have that I is a YES-instance of Π' $\Leftrightarrow r(I)$ is a YES-instance of Π .
 - Show that the algorithm runs in polynomial time.

Main Parameterized Complexity Classes

```
n: instance sizek: parameter
```

P: class of problems that can be solved in $n^{O(1)}$ time

FPT: class of parameterized problems that can be solved in $f(k) \cdot n^{O(1)}$ time

W[·]: parameterized intractability classes

XP: class of parameterized problems that can be solved in $f(k) \cdot n^{g(k)}$ time ("polynomial when k is a constant")

$$P \subseteq FPT \subseteq W[1] \subseteq W[2] \cdots \subseteq W[P] \subseteq XP$$

Note: We assume that f is computable and non-decreasing.

S. Huang (UNSW) Parameterized intractability Semester 2, 2017

Polynomial-time reductions for parameterized problems?

A vertex cover in a graph G=(V,E) is a subset of vertices $S\subseteq V$ such that every edge of G has an endpoint in S.

```
Vertex Cover
```

Input: Graph G, integer k

Parameter: k

Question: Does G have a vertex cover of size k?

An independent set in a graph G=(V,E) is a subset of vertices $S\subseteq V$ such that there is no edge $uv\in E$ with $u,v\in S$.

INDEPENDENT SET

Input: Graph G, integer k

Parameter: k

Question: Does G have an independent set of size k?

S. Huang (UNSW) Parameterized interested in a realistic Semester 2, 2017

Polynomial-time reductions for parameterized problems?

A vertex cover in a graph G=(V,E) is a subset of vertices $S\subseteq V$ such that every edge of G has an endpoint in S.

Vertex Cover

Input: Graph G, integer k

Parameter: k

Question: Does G have a vertex cover of size k?

An independent set in a graph G=(V,E) is a subset of vertices $S\subseteq V$ such that there is no edge $uv\in E$ with $u,v\in S$.

INDEPENDENT SET

Input: Graph G, integer k

Parameter: k

Question: Does G have an independent set of size k?

- We know: Independent Set ≤_P Vertex Cover
- However: $VERTEX\ COVER \in \mathsf{FPT}\ \mathsf{but}\ INDEPENDENT\ SET$ is not known to be in FPT

S. Huang (UNSW) Paramoterized introducibility Semester 2, 2017

We will need another type of reductions

• Issue with polynomial-time reductions: parameter can change arbitrarily.

We will need another type of reductions

- Issue with polynomial-time reductions: parameter can change arbitrarily.
- We will want the reduction to produce an instance where the parameter is bounded by a function of the parameter of the original instance.

S. Huang (UNSW) Semester 2, 2017

We will need another type of reductions

- Issue with polynomial-time reductions: parameter can change arbitrarily.
- We will want the reduction to produce an instance where the parameter is bounded by a function of the parameter of the original instance.
- Also: we can allow the reduction to take FPT time instead of only polynomial time.

Parameterized reduction

Definition 6

A parameterized reduction from a parameterized decision problem Π_1 to a parameterized decision problem Π_2 is an algorithm, which, for any instance I of Π_1 with parameter k produces an instance I' of Π_2 with parameter k' such that

- I is a YES-instance for $\Pi_1 \Leftrightarrow I'$ is a YES-instance for Π_2 ,
- there exists a computable function g such that $k' \leq g(k)$, and
- there exists a computable function f such that the running time of the algorithm is $f(k) \cdot |I|^{O(1)}$.

If there exists a parameterized reduction from Π_1 to Π_2 , we write $\Pi_1 \leq_{\mathsf{FPT}} \Pi_2$.

Note: We can assume that f and g are non-decreasing.

New FPT algorithms via reductions

Lemma 7

If Π_1, Π_2 are parameterized decision problems such that $\Pi_1 \leq_{\mathsf{FPT}} \Pi_2$, then $\Pi_2 \in \mathsf{FPT}$ implies $\Pi_1 \in \mathsf{FPT}$.

Proof sketch.

To obtain an FPTalgorithm for Π_1 , perform the reduction and then use an FPTalgorithm for Π_2 on the resulting instance.

Boolean Circuits

Definition 8

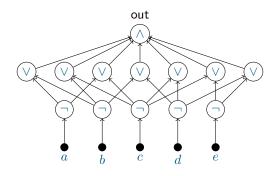

A Boolean circuit is a directed acyclic graph with the nodes labeled as follows:

- every node of in-degree 0 is an input node,
- every node with in-degree 1 is a negation node (\neg) , and
- ullet every node with in-degree ≥ 2 is either an AND-node (\wedge) or an OR-node (\vee).

Moreover, exactly one node with out-degree 0 is also labeled the output node. The depth of the circuit is the maximum length of a directed path from an input node to the output node.

The weft of the circuit is the maximum number of nodes with in-degree ≥ 3 on a directed path from an input node to the output node.

Example

A depth-3, weft-1 Boolean circuit with inputs a,b,c,d,e.

S. Huang (UNSW) Parasasasas Semester 2, 2017

Weighted Circuit Satisfiability

Given an assignment of Boolean values to the input gates, the circuit determines Boolean values at each node in the obvious way.

If the value of the output node is 1 for an input assignment, we say that this assignment satisfies the circuit.

The weight of an assignment is its number of 1s.

WEIGHTED CIRCUIT SATISFIABILITY (WCS)

Input: A Boolean circuit C, an integer k

Parameter: k

Question: Is there an assignment with weight k that satisfies C?

Exercise: Show that WEIGHTED CIRCUIT SATISFIABILITY ∈ XP.

WCS for special circuits

Definition 9

The class of circuits $C_{t,d}$ contains the circuits with weft $\leq t$ and depth $\leq d$.

For any class of circuits C, we can define the following problem.

WCS[C]

Input: A Boolean circuit $C \in \mathcal{C}$, an integer k

Parameter: k

Question: Is there an assignment with weight k that satisfies C?

S. Huang (UNSW) Remarkative introduction (UNSW) Semester 2, 2017

W classes

Definition 10 (W-hierarchy)

Let $t \in \{1, 2, \dots\}$. A parameterized problem Π is in the parameterized complexity class $\mathbf{W}[t]$ if there exists a parameterized reduction from Π to $\mathsf{WCS}[\mathcal{C}_{t,d}]$ for some constant $d \geq 1$.

S. Huang (UNSW) Paramoterized introducibility Semester 2, 2017

Independent Set and Dominating Set

Theorem 11

Independent Set $\in W[1]$.

Theorem 12

Dominating Set $\in W[2]$.

Recall: A dominating set of a graph G=(V,E) is a set of vertices $S\subseteq V$ such that $N_G[S]=V$.

DOMINATING SET

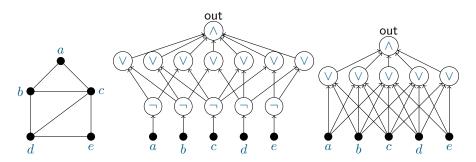

Input: A graph G = (V, E) and an integer k

Parameter: k

Question: Does G have a dominating set of size at most k?

"Proof" by picture

Parameterized reductions from Independent Set to WCS[$\mathcal{C}_{1,3}$] and from Dominating Set to WCS[$\mathcal{C}_{2,2}$].

Setting an input node to 1 corresponds to adding the corresponding vertex to the independent set / dominating set.

S. Huang (UNSW) Foremoserate Interest Misses Billion Semester 2, 2017

W-hardness

Definition 13

```
Let t \in \{1, 2, \dots\}.
```

A parameterized decision problem Π is W[t]-hard if for every parameterized decision problem Π' in W[t], there is a parameterized reduction from Π' to Π . Π is W[t]-complete if $\Pi \in W[t]$ and Π is W[t]-hard.

W-hardness

Definition 13

Let $t \in \{1, 2, \dots\}$.

A parameterized decision problem Π is W[t]-hard if for every parameterized decision problem Π' in W[t], there is a parameterized reduction from Π' to Π . Π is W[t]-complete if $\Pi \in W[t]$ and Π is W[t]-hard.

Theorem 14

INDEPENDENT SET is W[1]-complete.

Downey, R.G., Fellows, M.R.: Fixed-parameter tractability and completeness II: On completeness for W[1]. Theoretical Computer Science 141(1&2), 109-131 (1995).

Theorem 15

DOMINATING SET is W[2]-complete.

Downey, R.G., Fellows, M.R.: Fixed-parameter tractability and completeness I: Basic results. SIAM J. Computing 24(4), 873–921 (1995).

S. Huang (UNSW) Parameterized intractability Semester 2, 2017

Proving W-hardness

To show that a parameterized decision problem Π is W[t]-hard:

- Select a W[t]-hard problem Π'
- Show that $\Pi' \leq_{\mathsf{FPT}} \Pi$ by designing a parameterized reduction from Π' to Π
 - Design an algorithm, that, for any instance I' of Π' with parameter k', produces an equivalent instance I of Π with parameter k
 - Show that k is upper bounded by a function of k'
 - Show that there exists a function f such that the running time of the algorithm is $f(k') \cdot |I'|^{O(1)}$

Clique

A clique in a graph G=(V,E) is a subset of its vertices $S\subseteq V$ such that every two vertices from S are adjacent in G.

CLIQUE

Input: Graph G = (V, E), integer k

Parameter: k

Question: Does G have a clique of size k?

 We will show that CLIQUE is W[1]-hard by a parameterized reduction from INDEPENDENT SET.

S. Huang (UNSW) Faramasarkes historiality Semester 2, 2017

Clique is W[1]-hard

Lemma 16

Independent Set \leq_{FPT} Clique.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

S. Huang (UNSW) Paramaterized interestility Semester 2, 2017

Lemma 16

Independent Set \leq_{FPT} Clique.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\})$.

S. Huang (UNSW) Ferrometrical interceptibility Semester 2, 2017

Lemma 16

Independent Set \leq_{FPT} Clique.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\})$. **Equivalence.** We need to show that (G, k) is a YES-instance for INDEPENDENT SET if and only if (G', k') is a YES-instance for CLIQUE.

S. Huang (UNSW) Semester 2, 2017

Lemma 16

Independent Set \leq_{FPT} Clique.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\})$.

Equivalence. We need to show that (G, k) is a YES-instance for INDEPENDENT SET if and only if (G', k') is a YES-instance for CLIQUE.

 (\Rightarrow) : Let S be an independent set of size k in G. For every two vertices $u,v\in S$, we have that $uv\notin E$. Therefore, $uv\in E(\overline{G})$ for every two vertices in S. We conclude that S is a clique of size k in \overline{G} .

S. Huang (UNSW) Remarkative introduction (UNSW) Semester 2, 2017

Lemma 16

INDEPENDENT SET < FPT CLIQUE.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\})$.

Equivalence. We need to show that (G, k) is a YES-instance for INDEPENDENT SET if and only if (G', k') is a YES-instance for CLIQUE.

- (\Rightarrow) : Let S be an independent set of size k in G. For every two vertices $u,v\in S$, we have that $uv\notin E$. Therefore, $uv\in E(\overline{G})$ for every two vertices in S. We conclude that S is a clique of size k in \overline{G} .
- (\Leftarrow) : Let S be a clique of size k in \overline{G} . By a similar argument, S is an independent set of size k in G.

S. Huang (UNSW) Faramasarkes historiality Semester 2, 2017

Lemma 16

INDEPENDENT SET < FPT CLIQUE.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\})$.

Equivalence. We need to show that (G, k) is a YES-instance for INDEPENDENT SET if and only if (G', k') is a YES-instance for CLIQUE.

 (\Rightarrow) : Let S be an independent set of size k in G. For every two vertices $u,v\in S$, we have that $uv\notin E$. Therefore, $uv\in E(\overline{G})$ for every two vertices in S. We conclude that S is a clique of size k in \overline{G} .

 (\Leftarrow) : Let S be a clique of size k in \overline{G} . By a similar argument, S is an independent set of size k in G.

Parameter. $k' \le k$.

S. Huang (UNSW) Pagingarped intracability Semester 2, 2017

Lemma 16

INDEPENDENT SET < FPT CLIQUE.

Proof.

Given any instance (G=(V,E),k) for INDEPENDENT SET, we need to describe an FPT algorithm that constructs an equivalent instance (G',k') for CLIQUE such that $k' \leq g(k)$ for some computable function g.

Construction. Set $k' \leftarrow k$ and $G' \leftarrow \overline{G} = (V, \{uv : u, v \in V, u \neq v, uv \notin E\}).$

Equivalence. We need to show that (G, k) is a YES-instance for INDEPENDENT SET if and only if (G', k') is a YES-instance for CLIQUE.

 (\Rightarrow) : Let S be an independent set of size k in G. For every two vertices $u,v\in S$, we have that $uv\notin E$. Therefore, $uv\in E(\overline{G})$ for every two vertices in S. We conclude that S is a clique of size k in \overline{G} .

 (\Leftarrow) : Let S be a clique of size k in \overline{G} . By a similar argument, S is an independent set of size k in G.

Parameter. $k' \leq k$.

Running time. The construction can clearly be done in FPT time, and even in polynomial time.

S. Huang (UNSW) Paramaterized interceptible Semester 2, 2017

Corollary 17

CLIQUE is W[1]-hard

S. Huang (UNSW) Parameterized introduction Semester 2, 2017

Exercise

Recall: A k-coloring of a graph G = (V, E) is a function $f : V \to \{1, 2, ..., k\}$ assigning colors to V such that no two adjacent vertices receive the same color.

MULTICOLOR CLIQUE

Input: A graph G = (V, E), an integer k, and a k-coloring of G

Parameter: k

Question: Does G have a clique of size k that contains exactly one vertex

from each color class?

• Show that MULTICOLOR CLIQUE is W[1]-hard.

S. Huang (UNSW) Parameter is the investigation of the second second investigation of the second seco

Exercise

A set system S is a pair (V, H), where V is a finite set of elements and H is a set of subsets of V.

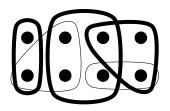

A set cover of a set system $\mathcal{S}=(V,H)$ is a subset X of H such that each element of V is contained in at least one of the sets in X, i.e., $\bigcup_{Y\in X}Y=V$.

Set Cover

Input: A set system S = (V, H) and an integer k

Parameter: *i*

Question: Does S have a set cover of cardinality at most k?

• Show that SET COVER is W[2]-hard.

S. Huang (UNSW) Parameterized introducible Semester 2, 2017

Exercise

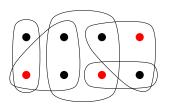

A hitting set of a set system $\mathcal{S}=(V,H)$ is a subset X of V such that X contains at least one element of each set in H, i.e., $X\cap Y\neq\emptyset$ for each $Y\in H$.

HITTING SET

Input: A set system S = (V, H) and an integer k

Parameter: k

Question: Does S have a hitting set of size at most k?

• Show that HITTING SET is W[2]-hard.
